Based on voltage feedforward photovoltaic inverter

What is angular frequency of PV inverter?

The voltage feedforward controller can be adopted in the synchronization unit to make PV inverter stable in strong grid like the HS-GFM control for power based GFM in ,,,. Therefore,angular frequency can be expressed as (3) with =100 rad/s.

How does a PV inverter work?

The PV inverter is connected to the infinite bus with SCR=2. At the beginning PV inverter adopts HS-GFM control (case 4) with G u. PV inverter outputs about 0.79MW active power and 0.25MVar reactive power stably before 14 s. After 14 s, setting G u =0, system switches to conventional DC voltage based GFM control (case 3).

How do PV inverters respond to grid frequency variation?

After 14 s,setting G u =0,system switches to conventional DC voltage based GFM control (case 3). Then grid frequency steps to 50.05 Hz after t=15s,PV inverter responses to grid frequency variation and settles down according to the droop valuewith 10 × 0.05/50=0.01MW.

What is a capacitive voltage feedforward?

Different from the conventional grid voltage feedforward, the capacitive voltage type full feedforward will not amplify high frequency harmonics, and it can eliminate the capacitor current control and simplify the controller design.

What is the compound control strategy of Pi + grid voltage feed-forward control?

The compound control strategy of PI +Grid voltage feed-forward control is to suppress current harmonics of the system(Cai et al. 2018). Although the grid-connected current harmonics are suppressed,the dynamic performance of the system needs to be further improved.

Are grid-connected inverters under weak grids unstable?

In summary,this article takes grid-connected inverters under weak grids as the research object,establishes an inverter output impedance model based on full feedforward control of capacitor voltage and takes phase-locked loop into account,and analyzes locks in weak grids. The phase loop causes the system to be unstable.

Aiming at the stability problem of grid-connected inverter under extremely weak grid, firstly, the q-axis output impedance model is constructed, and the stability margin of grid ...

In this control logic, the DC voltage can be utilized as the feedback signal to help VSC achieve synchronism. Similar ideas can be found in where the DVSC was applied in ...

To enhance the robust stability of the dc-link voltage in the photovoltaic (PV) grid-connected system, a modified linear active disturbance rejection control (LADRC)-based ...

The proposed control strategy for dual two-level inverter (DTLI)-based PV system includes two cascaded loops: (i) an inner current control loop that generates inverter voltage references, (ii) an outer dc-link voltage control ...

For the conventional two-stage grid-connected photovoltaic (PV) inverter, the second stage usually adopts the voltage-current double closed-loop control. When the output power of PV ...

Since the output voltage accuracy of the off-grid inverter is low with the proportional-integral (PI) control and a two-stage inverter is often used in the low input voltage application, a single ...

The PV system operates with an additional feed-forward control loop (FFCL), in order to improve the dynamic behavior of both dc-bus voltage and inverter currents, when the ...

2.1 System Structure and Control Scheme . The system structure studied in this paper is shown in Fig. 1.VCI is mainly composed of DC side, inverter bridge and LC filter. L f is ...

To solve the power coupling issue and avoid interference between active power and reactive power control loops, a decoupling strategy based on feedforward control is proposed in this paper. The basic idea is as ...
