

Can the system error memory dump file on disk C be deleted

Is it safe to delete system error memory dump files?

So it is safe to delete system error memory dump files. By deleting system error memory dump files, you can get some free space on your system disk. However, dump files can be recreated automatically every time when there is a system crash. So it is necessary to delete system error memory dump files on a regular basis.

How to delete system error memory dump files on C drive?

Using third-party space analyzer is also a simple way for you to delete the system error memory dump files on the C drive. And I recommend you to use the Space Analyzer embedded in MiniTool Partition Wizard Free Edition, for it is a piece of 100% safe and reliable partition and disk management software.

What is a complete memory dump file?

Complete memory dump: this type of memory dump file takes up the most disk space, as it contains a copy of all the data used by your operating system in the physical memory. Let me explain it to you with an example: If Windows uses 6GB at the time of the system crash, the memory dump will be of 4GB as well.

How do I clean up a memory dump file?

You can delete these system error memory dump files to free up disk space. If the memory dump file has grown over time, delete the file to restore hard drive space. The easiest way to clean up dump files is to perform an elevated cleanup using the built-in Disk Cleanup utility. Open Start and search for Disk Cleanup.

How do I remove system error memory dump files from Windows 10?

Check the box next to "System error memory dump files"; if it isn't selected by default. You can check the boxes for other options as well to free up more space. Click the "Remove files" button at the top of the window. Windows will remove the system error memory dump files from your PC. You can also fire up the Disk Cleanup tool.

How does Windows 10 memory dump work?

Here's how it works. On Windows 10, when a critical error occurs (such as Blue Screen of Death (BSOD)), the system creates memory dump files (also known as "crash dumps"). These files contain a copy of the system memory at the moment of the crash, which can help to diagnose and determine the reason for the problem.

The crash dump file of Windows 10 contains a copy of the system memory at the moment of the crash, allowing users to diagnose the problem later. The file is usually stored in the local system folder and gets ...
