Electrostatic double-layer capacitors (EDLC), or supercapacitors (supercaps), are effective energy storage devices that bridge the functionality gap between larger and heavier battery-based systems and bulk capacitors. Supercaps can tolerate significantly more rapid charge and discharge cycles than rechargeable batteries can.

The energy storage capacity of a battery or capacitor is measured in watt-hours. This is the number of watt hours a battery or capacitor can store. Usually, batteries have a higher watt-hour rating than capacitors. When choosing between capacitors and batteries, think about how much energy you need to store. If you need a lot of energy for a ...

oCapacitors can be readily scaled to create small or large grid storage systems oCapacitor technology has potential storage costs of < \$0.05/kWh(5000 cycles) oTwo early-stage US companies mentioned--developing capacitor bulk-storage oDecommissioned generating plants are candidate locations for capacitor storage
