Why is lithium so popular in Chile?

Lithium has characteristics that make it technically superior: it is lighter, safer, and has a higher energy density. Chile is in pole position to supply lithium to the global market. It owns 36 percent of economically recoverable lithium reserves and accounts for about 26 percent of global production.

Is lithium a critical energy resource in Chile?

The global and regional significance of lithium as a critical energy resource is examined. The evolution of Chile's lithium industry is analyzed, emphasizing two recent key policy initiatives: the 2015 National Lithium Commission report and the newly launched national lithium strategy. The salient features of these initiatives are outlined.

Will Chile's lithium supply deficit affect EV adoption?

The world is not on track to meet this lithium demand, with an expected deficit of 12.5 percent by 2030. Supply deficits mean higher lithium prices, which in turn will be reflected in higher battery costs, slowing down EV adoption. Any setback to Chile's lithium supply would add to that supply deficit and to costs.

Who owns the lithium industry in Chile?

Currently, the primary players in Chile's lithium industry are SQM, accounting for approximately 65% of production, and Albemarle, holding 35%. Both companies operate in the Salar de Atacama, where they control 34% of the world's lithium supply, equivalent to approximately 44 000 tons.

What is Chile's national lithium strategy?

Chile is positioned to lead global technological advancements in lithium production and capitalize on the associated economic benefits for national and regional development. Therefore, a national strategy is essential to effectively seize these opportunities. 3.4.1. Objectives and strategic pillars of Chile's national lithium strategy
