

Cost-effectiveness of soft and hard solar panels

What are solar soft costs?

Soft costs refer to the non-hardware costs associated with going solar. These costs include permitting, financing, and installing solar, as well as the expenses solar companies incur to acquire new customers, pay suppliers, and cover their bottom line. These soft costs become a portion of the overall price a customer pays for a solar energy system.

Can soft technology help reduce solar energy costs?

Engineers could consider making solar energy systems less reliant on soft technology to begin with, or they could tackle the problem directly by improving inefficient deployment processes to help reduce solar energy costs.

How does a hardware technology feature affect solar energy soft costs?

The researchers found that hardware technology features, such as increased photovoltaic module efficiency, have the greatest impacts on driving down soft costs in solar energy systems. It is important to consider how these hardware improvements affect soft costs as well.

What is solar energy cost analysis?

Solar energy cost analysis examines hardware and non-hardware (soft) manufacturing and installation costs, including the effect of policy and market impacts. Solar energy data analysis examines a wide range of issues such as solar adoption trends and the performance and reliability of solar energy generation facilities.

How much does it cost to install solar panels?

For most homeowners, the decision to install solar panels is primarily driven by cost. The average cost of solar panels as of Spring 2024 was \$3.40 per watt, excluding financing. This price includes both hard costs, like hardware and equipment, and soft costs, like installation labor costs, solar loan costs and fees, and required permitting.

How much does a solar PV system cost?

"A significant portion of the cost declines over the past decade can be attributed to an 85% cost decline in module price. A decade ago, the module alone cost around \$2.50 per watt, and now an entire utility-scale PV system costs around \$1 per watt," said NREL Senior Financial Analyst David Feldman.
