What are DC lighting and building microgrids?

Direct current (DC) electricity has the potential to improve the resiliency, reliability, and energy efficiency of building systems, specifically in the context of DC lighting and building microgrids.

What is a dc microgrid?

"DC microgrids will connect renewables, hydrogen and energy storage with EV charging and electronic consumers in the most efficient way possible. With the SACE Infinitus DC circuit breaker, ABB already has next-generation hardware solutions for DC microgrids performing in customer trials.

Does a DC microgrid save energy in a building?

Although an efficiency savings of 10-18% for a DC lighting and building microgrid is significant, it saves energyby aligning the DC microgrid voltage with the voltage(s) accepted by other building loads. Lighting is not the only possible DC load.

What is a microgrid?

Microgrids are the answer for a more sustainable, resilient and digital energy. This power system concept represents the evolution of the new electrical distribution based on distributed energy resources in commercial buildings and industrial plants.

What type of electricity does a microgrid produce?

Microgrids can produce either alternating current (AC) or direct current (DC)electricity. AC electricity is an electric current that periodically reverses direction, while DC flows in one direction. Solar PV panels produce DC electricity. Microgrids can be either AC or DC or a hybrid.

What is a DC lighting & microgrid RFI?

The RFI aimed to characterize availability and trends in the technical aspects of DC lighting and microgrid products and systems. It also sought qualitative analyses of the opportunities and challenges facing the industry. The RFI was released on April 23,2020, and received 46 responses over 9 weeks.
