

# Diodes that generate electricity using solar energy

Why do solar panels use bypass diodes?

This use of bypass diodes in solar panels allows a series (called a string) of connected cells or panels to continue supplying power at a reduced voltage rather than no power at all. Bypass diodes are connected in reverse bias between a solar cells (or panel) positive and negative output terminals and has no effect on its output.

### What are solar diodes used for?

The advantage of this is that diodes can be used to block the flow of electric currentfrom other parts of an electrical solar circuit. When used with a photovoltaic solar panel, these types of silicon diodes are generally referred to as Blocking Diodes.

What are the different types of solar diodes?

Two types of diodes are available as bypass diodes in solar panels and arrays: the PN-junction silicon diode and the Schottky barrier diode. Both are available with a wide range of current ratings. The Schottky barrier diode has a much lower forward voltage drop of about 0.4 volts as opposed to the PN diodes 0.7 volt drop for a silicon device.

### How do bypass diodes work?

Bypass diodes are connected in reverse bias between a solar cells (or panel) positive and negative output terminals and has no effect on its output. Ideally there would be one bypass diode for each solar cell, but this can be rather expensive so generally one diode is used per small group of series cells.

### What is a blocking diode?

Blocking diodes are used differently than bypass diodes. Bypass diodes in solar panels are connected in "parallel" with a photovoltaic cell or panel to shunt the current around it, whereas blocking diodes are connected in "series" with the PV panels to prevent current flowing back into them.

What is the difference between a silicon diode and a solar cell?

[Sarang]was studying solar cells and realized a standard silicon diode is very similar; both are p-n junctions and the only real difference is the surface area. He connected a 1N4148 to a multimeter and to his surprise it worked. [Sarang]is able to get about 150 millivolts out of his diode with the help of a magnifying glass.
