

# Domestic new energy storage policy

Can long-duration energy storage improve energy security?

The Committee's report on long-duration energy storage concludes that the Government must act fast to ensure that energy storage technologies can scale up in time to play a vital role in decarbonising the electricity system and ensuring energy security by 2035. Long-duration energy storage can reduce curtailment of renewables and grid congestion.

How much government funding has been given to energy storage projects?

This was published under the 2022 to 2024 Sunak Conservative government. Over £32 million government funding has been awarded to UK projects developing cutting-edge innovative energy storage technologies that can help increase the resilience of the UK's electricity grid while also maximising value for money.

Should the UK invest in a strategic reserve of electricity storage?

A strategic reserve of electricity storage is a critical investment to secure the UK's energy supply against future shocks, but the Government is still equivocating over whether it is necessary to invest in one. Since 2023, the Government has had a Department for Energy Security and Net Zero.

Will energy storage help a decarbonised power system?

Therefore, the government has said a decarbonised power system will need to be supported by technologies that can respond to fluctuations in supply and demand, including energy storage. The government expects demand for grid energy storage to rise to 10 gigawatt hours (GWh) by 2030 and 20 GWh by 2035.

Does the UK need long-duration energy storage?

Long-duration energy storage is critical for ensuring the UK can have both, so it must be a key priority for the Department. The Government says it wants to deploy enough storage both to balance and to decarbonise the electricity system by 2035, but we are not on track.

What is electricity storage?

Electricity storage covers a range of technologies that can deploy at different scales and provide output for different durations. This includes lithium-ion battery storage and pumped hydro storage as well as emerging technologies including liquid air energy storage and flow batteries.

Europe and China are leading the installation of new pumped storage capacity - fuelled by the motion of water. Batteries are now being built at grid-scale in countries including ...

The Energy Act 2023 has received Royal Assent and will transform the UK's energy system by strengthening energy security, supporting the delivery of net zero and ensuring household bills are ...

# Domestic new energy storage policy

Energy storage manufacturers are building domestic supply chains and experimenting with new materials to bring about the future of clean energy. Nearly 200 countries gathered at the U.N. Climate Summit and ...

Concerning large-scale domestic energy storage, the anticipated growth rate in installed capacity for next year remains significant. Simultaneously, the potential for further ...

In June 2023, China achieved a significant milestone in its transition to clean energy. For the first time, its total installed non-fossil fuel energy power generation capacity surpassed that of fossil fuel energy, ...

In a bid to incentivise the creation of energy storage in Ireland, the government is developing a policy framework to help deliver their objectives in this area of its Climate Action Plan which is targeting a proportion of ...

The Committee's report on long-duration energy storage concludes that the Government must act fast to ensure that energy storage technologies can scale up in time to play a vital role in decarbonising the ...
