What is dynamic modelling and integration of solar PV and wind power systems?

The present paper describes the dynamic modelling and integration of solar PV and wind power generation systems in the time-domain simulation of power systems. The developed models are based on the notion that the dynamics of the converter perform the main role in the interaction of the renewable generators with the rest of the power system.

Do PV generators need to be dynamically modeled?

Like all the other dynamic components, such as generators or motors, a PV generator needs to be modeled dynamically for the purpose of power system dynamic simulation.

How do you create a dynamic model for a power system?

A straightforward idea for developing a dynamic model for any power system dynamic component is to divide the dynamic component into its subsystems, then build a dynamic model for each subsystem, and finally put them all together to form the complete model of the whole dynamic component. This can also be applied to modelling a PV generator.

How to create a dynamic model for a two-stage converter PV generator?

How is a PV generator modeled in a power system steady state study?

A PV generator is modeled as a constant active power and reactive power source in power system steady state studies. When PV generation changes due to the ambient environment, the power system steady state studies do not investigate the transients of the power system caused by the change in PV generation.

How does a PV generation system work?

A commonly used PV generation system takes a two-stage topology as shown in Fig. 1, where, normally the first stage is typically a DC/DC converter performing the power extraction from PV arrays. The second stage is typically a DC/AC converter ensuring a constant DC-link voltage and maintaining the power balance between DC and AC sides.
