

Energy storage module loading and unloading

How does a Uges energy storage system work?

When there is excess electrical energy in the grid,UGES can store electricity by elevating sand from the mine and depositing it in upper storage sites on top of the mine. Unlike battery energy storage,the energy storage medium of UGES is sand,which means the self-discharge rate of the system is zero,enabling ultra-long energy storage times.

What if a container is unloaded on the unloading platform?

If the container is unloaded on the unloading platform,it is required to be used with the unloading platform or tooling. The height of the unloading platform and the height of the unloading tooling should be kept at the basic level with the bottom of the container (loading bottom plate),and the height tolerance should be controlled within ± 10 mm.

What are electrical energy storage systems (EESS)?

Electrical energy storage systems (EESS) for electrical installations are becoming more prevalent. EESS provide storage of electrical energy so that it can be used later. The approach is not new: EESS in the form of battery-backed uninterruptible power supplies (UPS) have been used for many years. EESS are starting to be used for other purposes.

How to store the modules?

The modules shall be stored in a complete outer package. The storage area shall be protected pallets and boxes from damp,direct sunlight and waterproof (rain) measures; The modules should be placed neatly with a safe distance between the boxes. The spacing between boxes should be greater than 30cm(Figure 10);

Do you need a fuel oil forklift to unload a module?

If the modules are unloaded from long side forks,fuel oil forklifts are needed to unload. When someone is required to direct the hoisting box to fall during unloading,it shall be kept as flat as possible to avoid collision and throwing of the module box,and the ground shall be flat (Figure 8).

What is the IET Code of practice for energy storage systems?

traction, e.g. in an electric vehicle.
