

Energy storage power supply Heard and McDonald Islands

Are small island energy companies able to develop storage systems?

Small island energy companies do not typically have the research or engineering capability to internally assess the viability of storage projects. Small island power companies find it difficult to raise the required finance for implementation of storage systems. Project costs here can be very significant relative to the scale of the system.

Why do Island power systems have low capacity compared to mainland power systems?

All island power systems will show relatively low capacity factors compared to mainland plant since islands must have a high level of reserve to ensure system security in the absence of integration into a wider power network.

Are interconnectors a viable option for on Island diesel generation?

On island diesel generation is both costly and environmentally unsustainable. Interconnectors can improve overall cost efficiency, although as they represent additional capacity, do not contribute to reduced capacity over peak load.

Why should a generation fleet of islands have a higher capacity reserve margin?

If the system is not interconnected, the generation fleet of islands must have a higher capacity reserve margin to ensure that the reliability of supplies are protected against possible engine failures and other generation difficulties, both planned and unplanned.

Electrical energy storage (EES) alternatives for storing energy in a grid scale are typically batteries and pumped-hydro storage (PHS). Batteries benefit from ever-decreasing capital costs [14] and will probably offer an affordable solution for storing energy for daily energy variations or provide ancillary services [15], [16], [17], [18]. However, the storage capability of ...
