What is a diesel generator air intake & exhaust system?

The diesel generator air intake and exhaust system (DGAIES) provides the diesel engine with combustion air from the outside. The combustion air passes through a filter and silencer before being compressed by a turbocharger and cooled by the coolant system before entering the individual cylinders for combustion.

Why do generator exhaust systems need to be properly designed?

Generator exhaust systems need to be properly designed to ensure correct engine performance and safe operation. System design has become more complex with the desire to keep emissions low, along with the desire to utilize the heat energy in the exhaust gas.

Do generator exhaust systems need to be insulated?

Generator exhaust systems are insulated to reduce the amount of heat radiated to the mechanical space, chase, and chimney. Based on the system routing, a risk of direct contact to the system by maintenance or repair personnel must also be considered. The maximum exhaust gas temperature determines the amount of insulation required.

Who designs and installs a generator exhaust system?

The proper design and functionality of a generator exhaust system falls on the responsibility of the engineering firm of record. If a field fabricated system is being utilized, the design and installation of the system must be a collaboration between the engineering firm and the installing contractor.

What temperature does a generator exhaust system emit?

Generator exhaust systems must also be engineered and properly installed to accommodate thermal expansion. Generator exhaust systems emit exhaust at temperatures anywhere from 500°F up to 1300°F depending on the unit size, manufacturer, and type of fuel burned.

Does field fabricated generator exhaust need insulation?

Field-fabricated generator exhaust also requires insulation. The amount and type of insulation should be stipulated by the mechanical engineer who is responsible for this system to ensure protection for the facility and personnel. Specific design and engineering required to ensure a safe reliable system.

Avoid locating exhaust vents within 10 feet above outdoor living areas (e.g. deck, patio, play yard) Avoid locating exhaust vents beneath canopies, overhangs or within recessed openings. Avoid locating exhaust vents in ...

Shaft: The shaft connects the turbine to the compressor and other components of the gas turbine. It transfers the mechanical energy from the rotating turbine to drive the compressor and any ...
