Does inlet air cool a gas turbine?

At temperatures below with such high relative humidity, icing of the compressor is probable. The exact increase in power available a particular gas turbine as a result of inlet air cooling depends upon the machine model and site altitude as well as ambient temperature and humidity.

Does an inlet air cooling system improve power output and efficiency?

Still, the results indicate that the power output and efficiency of the gas turbine improved as long as the ambient temperature remained at their lower values. Because of this, the incorporation of an inlet air cooling system could mitigate the negative influence of high temperatures in tropical locations.

What is a diesel generator air intake & exhaust system?

The diesel generator air intake and exhaust system (DGAIES) provides the diesel engine with combustion air from the outside. The combustion air passes through a filter and silencer before being compressed by a turbocharger and cooled by the coolant system before entering the individual cylinders for combustion.

What is a good air flow rate for a generator set?

Attention should be given to the velocity of intake air brought into the generator set room. If the air flow rate is too high, the generator sets will tend to pull rain and snow into the generator set room when they are running. A good design goal is to limit air velocity to between 500-700 f/min (150-220 m/min).

How many BTU does a generator muffler radiate?

The recommended generator set Specification Sheet indicates that the heat radiated to the room from the generator set (engine and generator) is 4,100 BTU/min. The muffler and 10 feet of 5-inch diameter exhaust pipe are also located inside the generator room. Determine the airflow required to limit the air temperature rise to 30°F.

How long should a generator run at full load?

If the temperature rise at full load and lower ambient temperatures is as predicted, it is more probable that it will operate correctly at higher ambients and load levels. Run the generator set at full load (1.0 power factor is acceptable) long enough for the engine coolant temperature to stabilize. This will take approximately 1 hour.
