How does inlet air cooling increase power output?

Inlet air cooling increases the power output by taking advantage of the gas turbine's feature of higher mass flow rate when the compressor inlet temperature decreases. Different methods are available for reducing gas turbine inlet temperature. There are two basic systems currently available for inlet cooling.

How gas turbine inlet air cooling increases power output?

During the warm months, a gas turbine inlet air cooling technique is a useful option for increasing output. Inlet air cooling increases the power output by taking advantage of the gas turbine's feature of higher mass flow rate, due to the compressor inlet temperature decays.

What is the compressor inlet temperature in a gas turbine?

The compressor inlet temperature in typical gas turbine is equal to ambient temperature. Air has been considered as ideal gas in all gas turbine cycle, also using the polytropic relation for ideal gas: Where  $C_p$  and  $C_v$  are specific heat at constant pressure and volume, respectively.

How to reduce gas turbine inlet temperature?

Different methods are available for reducing gas turbine inlet temperature. There are two basic systems currently available for inlet cooling. The first and most cost-effective system is evaporative cooling. Evaporative coolers make use of the evaporation of water to reduce the gas turbine's inlet air temperature.

What is gas turbine air inlet cooling?

Abstract-- Gas turbine air inlet cooling is a useful method for increasing output for regions where significant power demand and highest electricity prices occur during the warm months.

Does cooled inlet air make gas turbine cycle more efficient?

Results show after using the cooled inlet air, total power of the gas turbine increases by 518kW also the efficiency of gas turbine cycle increases by 7% and it makes this cycle more efficient and cost-effective. Inlet Temperature . The inlet temperature of the air has an impact on the density of the air at the intake of the compressor and will influence the kinetic energy transferred by the blades to the ...

We can use the isentropic temperature relation for this:  $T_2 = T_1 * (P_2/P_1)^{((g-1)/g)}$  where  $T_1$  is the inlet temperature (20°C),  $P_2/P_1$  is the pressure ratio (3.16), and  $g$  is the specific heat ratio ...

Air enters the compressor of an ideal cold air-standard Brayton cycle at 100 kPa (abs) and 300 K, with a mass flow rate of 6 kg/s. The compressor pressure ratio is 10 and the turbine inlet ...

The compressors have equal pressure ratios and intercooling is complete between stages. The air inlet temperature of the unit is 15 °C. The isentropic efficiency of each compressor stage is ...
