How does air temperature affect gen set cooling system sizing?

Altitude, air temperature and velocity greatly affect cooling ability and performance. Following are some rules of thumb that may be used in general gen set cooling system sizing exercises: For every 304.0m (1,000 feet) above sea level, deduct 1.38C (2 F) from the observed ambient temperature for a better indication of the air's cooling ability.

What is a diesel generator air intake & exhaust system?

The diesel generator air intake and exhaust system (DGAIES) provides the diesel engine with combustion air from the outside. The combustion air passes through a filter and silencer before being compressed by a turbocharger and cooled by the coolant system before entering the individual cylinders for combustion.

How to reduce genset room temperature and ventilation air requirement?

For higher ambient temperature, it is suggested to use ambieter (air handling system with cooler) to reduce genset room temperature and ventilation air requirement. hour so that temperature in the genset room gets stabilised. Measure the ambient air temperature (ambient temperature should be measured outside the genset room in shade).

How should a generator room be ventilated?

C.5 Enough opening / shutters should be provided to the D.G. room so that entry and placement of D.G. set is possible easily. Ventilation of the generator room is necessary to remove heat and fumes dissipated by the engine, alternator and its accessories and to provide clean and fresh combustion air.

Why is ventilation necessary in a generator room?

Ventilation of the generator room is necessary to remove heat and fumesdissipated by the engine, alternator and its accessories and to provide clean and fresh combustion air. Ventilation requirement is mandatory for all engines. Cross ventilation and free flow of cool, clean and fresh air is must for satisfactory operation of DG set.

Should a generator be installed in a line?

If the generators need to be installed in a line (end to end), this should only be considered for vertical discharge enclosures and the discharge plenums should be near each other. In-line installations oriented in the same direction run the risk of hot air from the first generator being ingested by the second generator.
