

Is grid-scale energy storage on the rise?

By the reckoning of the International Energy Agency (iea), a forecaster, grid-scale storage is now the fastest-growing of all the energy technologies. In 2025, some 80 gigawatts (gw) of new grid-scale energy storage will be added globally, an eight-fold increase from 2021. Grid-scale energy storage is on the rise thanks to four potent forces.

Who will be the winner of grid-scale battery energy storage?

China is likely to be the main winner from the increased use of grid-scale battery energy storage. Chinese battery companies BYD, CATL and EVE Energy are the three largest producers of energy storage batteries, especially the cheaper LFP batteries.

What are the different types of energy storage technologies?

Other storage technologies include compressed air and gravity storage, but they play a comparatively small role in current power systems. Additionally, hydrogen - which is detailed separately - is an emerging technology that has potential for the seasonal storage of renewable energy.

Will a new grid-scale storage project get a tax credit?

The United States' Inflation Reduction Act, passed in August 2022, includes an investment tax credit for stand-alone storage, which is expected to boost the competitiveness of new grid-scale storage projects.

Are lithium phosphate batteries a good choice for grid-scale storage?

Based on cost and energy density considerations, lithium iron phosphate batteries, a subset of lithium-ion batteries, are still the preferred choice for grid-scale storage.
