

Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($< 10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

Are hybrid nano-enhanced phase-change materials suitable for thermal energy storage?

The disparity between the supply and demand for thermal energy has encouraged scientists to develop effective thermal energy storage (TES) technologies. In this regard, hybrid nano-enhanced phase-change materials (HNePCMs) are integrated into a square enclosure for TES system analysis.

What is photo-thermal conversion phase-change composite energy storage?

Based on PCMs, photo-thermal conversion phase-change composite energy storage technology has advanced quickly in recent years and has been applied to solar collector systems, personal thermal management, battery thermal management, energy-efficient buildings and more. The future research should address:

Are hnepcms effective thermal energy storage materials?

Thus, HNePCMs are demonstrated to be more efficient materials and are emerging as potential materials to augment the performance of TES applications. The authors declare no conflict of interest. The disparity between the supply and demand for thermal energy has encouraged scientists to develop effective thermal energy storage (TES) technologies.

What are the selection criteria for thermal energy storage applications?

In particular, the melting point, thermal energy storage density and thermal conductivity of the organic, inorganic and eutectic phase change materials are the major selection criteria for various thermal energy storage applications with a wider operating temperature range.

Are phase change materials encapsulated inside cylindrical enclosures solidified?

Kalaiselvam et al. investigated the solidification and melting of the phase change materials encapsulated inside the cylindrical enclosures. Two models for solidification and three models for melting were used to find the interface locations at various time steps.
