What are liquid metal thermal energy storage systems?

Liquid metal thermal energy storage systems are capable of storing heat with a wide temperature rangeand have, thus, been investigated for liquid metal-based CSP systems 3,4 and in the recent past also been proposed for industrial processes with high temperature process heat. 5

What is high-temperature heat storage with liquid metals?

High-temperature heat storage with liquid metals can contribute to provide reliable industrial process heat >500°Cfrom renewable (excess) electricity via power-to-heat processes. Liquid metals can also be used to efficiently transport high-temperature waste heat from high-temperature industrial processes to a heat storage medium for later use.

What is high-temperature energy storage?

In high-temperature TES, energy is stored at temperatures ranging from 100°C to above 500°C.High-temperature technologies can be used for short- or long-term storage, similar to low-temperature technologies, and they can also be categorised as sensible, latent and thermochemical storage of heat and cooling (Table 6.4).

Which liquid temperature range is applicable to high-temperature heat storage?

Table 1 presents the liquid temperature ranges from melting to boiling temperature of selected liquid metals. In order to be applicable to high-temperature heat storage, the selection criteria are a maximum melting point of 400°C,a minimum boiling point of 700°C and existing operating experience.

Can liquid metals be used as heat transfer fluids in thermal energy storage?

The use of liquid metals as heat transfer fluids in thermal energy storage systems enables high heat transfer rates and a large operating temperature range (100°C to >700°C, depending on the liquid metal). Hence, different heat storage solutions have been proposed in the literature, which are summarized in this perspective.

What is thermal energy storage sizing & effectiveness?

TES sizing and effectiveness. Demand for high temperature storage is on a high rise, particularly with the advancement of circular economy as a solution to reduce global warming effects. Thermal energy storage can be used in concentrated solar power plants, waste heat recovery and conventional power plants to improve the thermal efficiency.

The low-temperature liquid air (A18) is stored in the liquid air tank (LAT) at 1.2 bar and -192.6 ?, marking the completion of the energy storage period during the valley hours.
