Are beam-to-column connections effective against progressive collapse?

Beam-to-column connections with appropriate robustness and reliable axial resistance are compulsory for developing the catenary actions where this stage is the final line of defense against progressive collapse. F Wang et al. investigated the behavior of bolted and welded flange plate connections subjected to progressive collapse [ 11 ].

How robust are beam-to-column connections in a double-span column removal scenario?

Since the robustness of connections preserves the integrity in a double-span column removal scenario, there is a necessity to investigate the beam-to-column connection performance under the simultaneous presence of moment, shear, and tension in conjunction with high ductility demand.

How do rooftop solar panels work?

Rooftop solar modules are usually held in place by racks or frames that are mechanically attached to a roof structure and/or by heavyweight, ballasted footing mounts. These mounts ensure that the panel system remains in position against wind load.

How to install solar panels on a roof?

The foremost requirement is the structural strength of the roof, which should be capable of supporting the additional weight of the solar panels and the mounting structure. The solar panel mounting structure is usually made of mild steel or aluminum, which adds minimal weight but provides adequate support to the panels 1.

Do all three beam-to-column connection categories address plastic rotation during sudden column removal?

This indicates that all three beam-to-column connection categories can addressadequate plastic rotation during sudden column removal. In addition,the results reveal that the suggested ductility acceptance criteria are on the conservative side for all three beam-to-column connection categories.

What should be considered during sudden column removal from the frame?

During sudden column removal from the frame,high attention should be paid to the load-carrying capacityof the double-span assembly above the removed column since it has an essential function in the progressive collapse prevention.

r is the yield of the solar panel given by the ratio : electrical power (in kWp) of one solar panel divided by the area of one panel. Example : the solar panel yield of a PV module of 250 Wp ...

By 2050, the United States is expected to have the second largest number of end-of-life panels in the world, with as many as an estimated 10 million total tons of panels. For more information on these and other solar ...
