

How to test the battery energy storage system

What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.

What is a battery energy storage system (BESS) e-book?

This document e-book aims to give an overview of the full process to specify, select, manufacture, test, ship and install a Battery Energy Storage System (BESS). The content listed in this document comes from Sinovoltaics' own BESS project experience and industry best practices.

What is energy storage performance testing?

Performance testing is a critical component of safe and reliable deployment of energy storage systems on the electric power grid. Specific performance tests can be applied to individual battery cells or to integrated energy storage systems.

What is battery capacity testing?

Capacity testing is performed to understand how much charge /energy a battery can store and how efficient it is. In energy storage applications, it is often just as important how much energy a battery can absorb, hence we measure both charge and discharge capacities.

Are batteries a viable energy storage technology?

Batteries have already proven to be a commercially viable energy storage technology. BESSs are modular systems that can be deployed in standard shipping containers. Until recently, high costs and low round trip efficiencies prevented the mass deployment of battery energy storage systems.

Can FEMP assess battery energy storage system performance?

This report describes development of an effort to assess Battery Energy Storage System (BESS) performance that the U.S. Department of Energy (DOE) Federal Energy Management Program (FEMP) and others can employ to evaluate performance of deployed BESS or solar photovoltaic (PV) +BESS systems.
