

What is Microgrid Certification Training?

Microgrid Certification Training is a 3-day course designed for all engineers who want to learn, design, or operate microgrids. It is also suitable for power traders to understand modern microgrid technologies and independent system operator personnel. The training covers understanding energy management systems (EMS) in microgrids, including centralized or decentralized microgrids.

What is a microgrid system?

A microgrid system combines photovoltaic (PV), wind turbine (WT), and Superconducting Magnetic Energy Storage (SMES) as a local power grid. To minimize the impact on the main grid, it is necessary to ensure stable power supply from the grid and reduce power flowing back to the grid.

What is a microgrid energy system?

A microgrid is a self-sufficient energy system that serves a discrete geographic footprint, such as a college campus, hospital complex, business center or neighborhood. Within microgrids are one or more kinds of distributed energy (solar panels, wind turbines, combined heat & power, generators) that produce its power.

What is included in the microgrid course?

The course includes a detailed view of the components that go into a microgrid as well as guidance on how to develop a business model, evaluate financing options, and navigate policy. An extended set of supporting tools for developing a microgrid--such as modeling software and system analyzers--are also discussed in detail.

What types of studies are conducted on microgrids?

The studies on microgrids are classified into two main topics: feasibility and economic studies, and control and optimization. The applications and types of microgrids are introduced first, and next, the objective of microgrid control is explained. Microgrid control falls under the categories of coordinated control and local control.
