

## Microgrid power capacity configuration program

What is the optimal capacity configuration model for a grid-connected microgrid?

An optimal capacity configuration model of the grid-connected microgrid is proposed, which comprehensively considers economic cost, renewable energy utilization efficiency and carbon emissions. Through the combination with the previous work, it provides a new solution to the problem of microgrid planning.

Is microgrid a good model for capacity planning?

An optimal grid-connected microgrid capacity configuration model is proposed. A case study is carried out to validate the proposed capacity planning solution. Microgrid is considered an efficient paradigmfor managing the massive number of distributed renewable generation and storage facilities.

Does es capacity and Dr reduce the cost of a microgrid?

The simulation results show that the optimal configuration of ES capacity and DR promotes renewable energy consumption and achieves peak shaving and valley filling, which reduces the total daily cost of the microgrid by 22%. Meanwhile, the DR model proposed in this paper has the best optimization results compared with a single type of the DR model.

Does capacity configuration optimization improve the stability of microgrids?

To improve the accuracy of capacity configuration of ES and the stability of microgrids, this study proposes a capacity configuration optimization model of ES for the microgrid, considering source-load prediction uncertainty and demand response (DR). First, a microgrid, including electric vehicles, is constructed.

Is there a capacity planning solution for grid-connected microgrid based on scenario generation? This paper presented an optimal capacity planning solution for grid-connected microgrid based on scenario generation considering multi-dimensional uncertainties. The efficient DCGAN based scenario generation method is developed to describe the uncertain behaviors of renewable power generation.

Why is degan used in microgrid capacity planning?

The DCGAN is adopted for scenario generation produce a sufficient number of power generation scenarios to cover the diverse system operational patterns. These scenarios are further clustered as a set of representative scenarios that are incorporated into the optimization process to obtain the robust microgrid capacity planning solution.
