

Niger e star energy

How is energy used in Niger?

Total energy supply (TES) includes all the energy produced in or imported to a country, minus that which is exported or stored. It represents all the energy required to supply end users in the country.

What is the energy potential of Niger?

Niger has significant energy potential, rich and varied, that is weakly exploited. It consists of biomass (firewood and agricultural residues, the main source used by households for cooking), uranium, mineral coal, oil, natural gas, hydroelectricity and solar energy.

Does Niger need electricity?

Access to electricity remains a challenge in Niger and the country is reliant on electricity imports for a significant share of its supply. The country is an oil resource centre and it is one of the ten-largest uranium resource-holders in the world.

Why is access to energy a problem in Niger?

Despite this rich potential, access to energy is still a challenge for the authorities. Final energy consumption in Niger is estimated at 0.15 toe per capita, one of the lowest in the world. The weakness of this value is mainly due to limited access of Niger's households to modern energy.

When did Niger sign the European Energy Charter?

Niger signed the European Energy Charter (1991) in April 2015 and the International Energy Charter (2015) in May 2015, which represents a strong signal from the authorities of their commitment to ensure better protection of foreign investments in the Republic of Niger. The process of ratification of the Treaty is in progress.

Is Niger a member of ECOWAS?

The outcome of this process has no doubt because Niger is a member of the Economic Community of West African States (ECOWAS). The ECOWAS protocol on energy, which was ratified by Niger in 2005, developed on the basis of principles of the Energy Charter Treaty.
