Is hyperspectral imaging effective for nondestructive testing and evaluation of PV cells?

Based on the findings and analysis presented in this study, our novel methodology demonstrates the effectiveness of our proposed hyperspectral (HS) imaging approach combined with K-means clustering (K-mc) for nondestructive testing and evaluation (NDT-NDE) of solar photovoltaic (PV) cells.

What is non-destructive testing & evaluation (NDT-NDE)?

Renewable energy, particularly solar energy, has experienced remarkable growth in recent years. However, the integrity of solar photovoltaic (PV) cells can degrade over time, necessitating non-destructive testing and evaluation (NDT-NDE) for quality control during production and in-service inspection.

Can hyperspectral imaging be used to identify a defect in PV cells?

However, the integrity of solar photovoltaic (PV) cells can degrade over time, necessitating non-destructive testing and evaluation (NDT-NDE) for quality control during production and in-service inspection. Hyperspectral (HS) imaging has emerged as a promising technique for defect identification in PV cells based on their spectral signatures.

Can thermal imaging detect a non-contact static diagnosis for PV cells?

Thermal imaging would not be able to identify temperature variations that could be indicative of flaws without electricity being connected to the panel. We assessed that by applying this thermal imaging technique to study the feasibility of getting a non-contact static diagnosis for PV cells using another approach.

Can a quick and non-contact approach be used to diagnose PV panels?

Overall, our proposed approach provides a quick and non-contact method for recognizing and diagnosing PV panels, ultimately leading to increased energy production and reduced maintenance costs.

What are non-destructive testing techniques (ndtts)?

To detect faults, non-destructive testing techniques (NDTTs) have been used. NDTTs are used to detect systems components conditions at production (Murayama et al., 1996), transportation, storage, installation (D'Orazio et al., 2008, Murayama et al., 1997), and operation (Ogawa et al., 1999).

Both destructive and non-destructive testing can give very reliable results. Destructive testing can only test a small number of samples (lot sampling). Non-destructive testing, on the other hand, can test entire batches. ...

The experiment results show that it is a good non-destructive method to test and evaluate the quality of the inner structure of polycrystalline silicon solar panel. The inner ...
