Should you install a solar thermal system for heating hot water?

Installing a solar thermal system for heating hot water is a good move for the environment. But before you go ahead, it's essential to know all the facts so you can decide if a solar hot water system is the right choice. First, it's important to point out that there are two types of solar panel systems:

Where will a solar thermal expansion tank be installed?

The expansion tank will be installed on the solar thermal loop (normally near the water tank and pumping station); this prevents pressure changes in the system damaging components. Special insulated pipes will be installed between the pumping station and the solar thermal collector.

Are solar hot water cylinders compatible with conventional boilers?

Conventional boilers and hot water cylinder systems are often compatible with solar water heating. However, if you have a , this will mean a solar hot water cylinder must be added to the system, so you'll need to consider where this might be located.

Can I install a solar hot water cylinder on my boiler?

Here's a guide to what you can expect: Check the boiler is compatible with solar water heating - standard boilers usually are, but if there is a combi boiler, a solar hot water cylinder must be added to the system, so you'll need to consider if there is enough space and where to install it.

Does a solar water heating system need a boiler or immersion heater?

As the amount of solar energy available varies throughout the year, a solar water heating system won't provide all the hot water needed. Solar thermal panels can produce around 80-90% of hot water in summer and 20-30% in winter - that's an average of up to 70% over a year. So, a boiler or immersion heater is needed to make up the difference.

How do I install solar hot water?

Solar Hot Water Installation? Think about where you will place your solar hot water collectors. Collectors should receive at least five hours of unobstructed sunlight per day, so look for a location that faces as close to south as possible (up to 90 degrees east or west of true south may still be viable) and think about trees or other buildings that
