How is a PV array sized for a stand-alone system?

The PV array for stand-alone systems is sized to meet the average daily loadduring the critical design month. System losses, soiling and higher operating temperatures are factored in estimating array output. The system voltage determines the number of series-connected modules required per source circuit.

What are the sizing principles for grid connected and stand-alone PV systems?

The sizing principles for grid connected and stand-alone PV systems are based on different design and functional requirements. Provide supplemental power to facility loads. Failure of PV system does not result in loss of loads. Designed to meet a specific electrical load requirement. Failure of PV system results in loss of load.

How are grid-connected PV systems sized?

Grid-connected systems are sized according to the power output of the PV array, rather than the load requirements of the building. This is because any power requirements above what a grid-connected PV system can provide is automatically drawn from the grid. 4.2.3. Surge Capacity

What factors limit the size of a solar photovoltaic system?

There are other factors that will limit the size of your solar photovoltaic system some of the most common are roof space, budget, local financial incentives and local regulations. When you look at your roof space it is important to take into consideration obstructions such as chimneys, plumbing vents, skylights and surrounding trees.

How much weight does a PV system add to a roof?

A conventional PV system that includes racking materials will add approximately 6 pounds per square footof dead load to the roof or structure, though actual weights can vary for different types of systems. Wind will add live loads; the magnitude of live loads will depend on the geographic region and the final PV system.

What are the different types of PV mounting systems?

Usually made from stainless steel or aluminium, most mounting systems are designed for universal application, and can come in a variety of styles including tilt frame, flat roof-mounted or ground-mounted. They can be customised to meet the size and specifications of a PV installation, as well as the style of roof or installation.
