Do you need a sunpath diagram for a solar PV installation?

The UK's Microgeneration Certification Scheme (MCS) released their Solar PV Guide called 'Guide to the Installation of Photovoltaic (PV) Systems' detailing requirements for solar PV installations. The published version indicates that installers will be required to record a shade or horizon line on a sunpath diagram to present to clients.

How do I know if my PV system is shading?

If we also map a shade mask (i.e. the shading cast from surrounding obstructions such as buildings, trees, power poles, chimneys) onto the sun-path diagram, we can then determine when there will be shading experience by the PV system throughout the year.

Do I need a shade or horizon line on a sunpath diagram?

The MCS 'Guide to the Installation of Photovoltaic (PV) Systems' requires installers to be required to record a shade or horizon line on a sunpath diagram to present to clients.

How does the MCS solar PV guide shading method work?

The MCS method uses boxes on the sunpath to estimate shading. Each box on the MCS diagram represents a part loss of system yield and the boxes are different shapes and areas.

What are the components of a photovoltaic system?

A photovoltaic system consists of various components that work together to convert sunlight into electricity. The main components of a PV system include: Solar panels: These are the primary component of a PV system and consist of numerous PV cells. Solar panels are responsible for capturing sunlight and converting it into electricity.

How to design a photovoltaic array?

Designing a photovoltaic array requires considerations such as location, solar irradiance, module efficiency, load demand, orientation, tilt angle, shading, and space constraints. It is crucial to optimize these factors for maximum energy production and cost-effectiveness. 2.
