

What is PV module impedance?

In the present work, the PV module impedance is evaluated from the perspective of evaluating the pre-charge current that can occur in a PV array when an inverter dc bus is connected. For this, the experimentally obtained current response is analysed as a simplified second-order model.

What are the limitations in PV panel impedance estimation?

Practical aspects of the PV array installation cause limitations in the impedance estimation. Voltage and current waveforms are measured at roof bus bar terminal as shown in figure 4. Due to this, the capacitance calculated not only reflects the PV panel capacitance but also includes the effect of cable capacitance.

How to measure AC2 impedance of a PV module?

In this document we show how the AC2 impedance of a PV module can be measured using the Bode 100 in conjunction with the J2130A DC Bias Injector from Picotest. The figure below shows a simplified equivalent circuit model of a photovoltaic module. The impedance of the examined photovoltaic module is very high (in the range of several 100 kΩ).

Can impedance spectroscopy be used in photovoltaics?

This publication is licensed under CC-BY-NC-ND. Impedance spectroscopy has been widely applied over the last decades to study electrochemical systems and solid-state devices. However, performing impedance spectroscopy on emerging photovoltaics presents new challenges related to the unusual material properties and complex device architectures.

Can physics be used to model impedance spectra of solar cells?

It is impossible to survey all the work that has been done. Instead, we focus on approaches in the literature that link the physics of solar cells to basic circuit building blocks that can be more generally applied to model the impedance spectra of some electrochemical and emerging PV devices.

What frequency is impedance spectroscopy performed on thin film PV?

Electrochemical impedance spectroscopy is done in the frequency range megahertz (microsecond) to subhertz (less than seconds), and most impedance spectroscopy performed on thin film PV is in this range as well. Measuring at lower or higher frequencies is possible but often presents technical challenges to acquire reliable data.
