

How do I design a photovoltaic and solar hot water system?

Provide an architectural drawing and riser diagram for the homeowner showing the planned location for future photovoltaic and solar hot water system components. Space requirements and layout for photovoltaic and solar water heating system components should be taken into account early in the design process.

What are solar panel mounting structures?

This is where solar panel mounting structures come into play. Solar Mounting Structures are critical components that ensure the efficiency of a solar power system in both utility and rooftop applications. These frameworks allow panels to rest comfortably at the right angle which helps in maximizing energy generation.

How many photovoltaic power plants should be installed?

To provide sufficient supply for the global energy consumption, a cumulative amount of 18 TW of photovoltaic power plants should be installed. This means the solar energy industry has a long way to reach to a point where at least 10% of the world energy consumption is generated by solar plants.

Do I need to meter a photovoltaic system?

It is assumed that aluminum framed photovoltaic (PV) panels mounted on a "post" and rail mounting system, the most common in the industry today, will be installed by the homeowner. While metering the system is encouraged, the specification does not address system wiring elements for associated system sensors or monitoring equipment.

What are photovoltaic panels & how do they work?

They are designed for builders constructing single family homes with pitched roofs, which offer adequate access to the attic after construction. It is assumed that aluminum framed photovoltaic (PV) panels mounted on a "post" and rail mounting system, the most common in the industry today, will be installed by the homeowner.

Where should a PV array be located?

The PV array should be located considering the aesthetics of the building. As well, the modules must be located so that building features such as gables and overhangs do not shade the modules. This usually means locating the array on the roof as close as possible to the ridge.
