

Principle of parallel resonance of photovoltaic inverter

What is the resonance mechanism of multi-inverter parallel systems?

The resonance mechanism of multi-inverter parallel systems is sorted out and summarized in , which conducts relevant research on resonance issues from different aspects, but no corresponding suppression strategy is proposed.

What is the resonance mechanism of photovoltaic grid-connected system?

The resonance mechanism of photovoltaic grid-connected system is analyzed based on frequency domain analysis method. The notch filter is added into the active damping control method, and the active damping of the system is enhanced by using the notch characteristics.

How many resonance peaks are there in a photovoltaic grid-connected system?

1. There are usually two resonance peaks in photovoltaic grid-connected system, one of which is the natural resonance peak produced by LCL filter. The other is the coupling resonance peak formed by the parallel connection of multiple inverters and the impedance coupling of the power grid.

Does grid impedance affect the stability of a multi-inverter parallel system?

Many studies on the stability analysis and suppression strategies of multi-inverter parallel systems have been conducted. In , the impact of grid impedance and changes in the number of inverters on the stability of inverter output current is analyzed without considering the interaction between inverters.

Can virtual branches be used for resonance analysis of control inverters?

Two typical control inverters were modelled under the transfer function model, and the defects of the traditional modal analysis method in traversing the series resonance were analyzed. Then, the authors propose to use an improved modal analysis method by adding virtual branches for resonance analysis.

Can multiple inverters traverse series and parallel resonance?

In order to prove the generality of the proposed method for traversing the series and parallel resonance of multiple grid-connected inverters, the inverter to suppress background harmonics of the grid voltage was incorporated into the multiple inverters net-work for case study.
