Cathodic Protection is the most widely applied electrochemical corrosion control technique. This is accomplished by applying a direct current to the structure such as pipelines, storage tanks, pressure vessels and others which causes the structure potential to change from the natural corrosion potential to a protective potential in the immunity region.

Based on the ultrasonic immersion testing principle. Ultrasonic sound wave is generated from a concave probe and transmitted into the 45° mirror mounted in a turbine, which reflect the sound wave to the tube wall.; Pressurized water is being used as couplant and rotates the turbine.

Post Weld Heat Treatment (PWHT) reduces the residual stresses formed during welding. It also restores the macro structure of the steel. Mandatory in high pressure applications, constructors have to strictly follow PWHT requirements to avoid component failures

A. On-Service Inspection (OSI): This inspection is performed while the tank is still in service. Inspection Scope mainly involves detailed visual examination on exterior of the tank done by an authorized API-653 inspector and ultrasonic thickness measurement of the shell & roof plate including all nozzles.
