Are second-life batteries a viable alternative to stationary batteries?

This story is contributed by Josh Lehman, Relyion Energy. Second-life batteries present an immediate opportunity, the viability of which will be proven or disproven in the next few years. Second-life batteries can considerably reduce the cost as well as the environmental impact of stationary battery energy storage.

Are second-life batteries profitable?

Scrutiny of economic feasibility and profitable uses for second-life batteries. Examination and comparison of power electronics for second-life battery performance. Due to the increasing volume of electric vehicles in automotive markets and the limited lifetime of onboard lithium-ion batteries, the large-scale retirement of batteries is imminent.

Can a second-life battery be reused?

The second-life battery (SLB) has the potential to generate more than 200 GWh by 2030, with a global value of more than \$30 billion, according to another report. In order to optimize their economic and environmental benefits, batteries with available residual values can be reused rather than recycled or disposed of.

How many gigawatts a year will lithium-ion batteries last?

Second-life lithium-ion battery supply could surpass 200 gigawatt-hours per year by 2030. Electric vehicle. Only for batteries from passenger cars. The fourth challenge is the immature regulatory regime.

Is repurposing second-hand EV batteries economically feasible?

Ref. investigated the economics of repurposing second-hand EV batteries in residential situations, finding that if the battery price is 38.3 EUR/kWh, which is the positive lower bound of the predicted price, repurposing EV LIBs is economically feasible. It could be difficult to make a profit if the battery price increases to 83 EUR/kWh.

How does the lithium-ion battery industry work?

The lithium-ion battery industry operates within an intricate chain involving manufacturers, electric vehicle producers, consumers, refurbishment firms, and recycling companies. Refurbishment and recycling companies, specializing in retired batteries, seek profits from low-priced units but struggle with lowering refurbishment costs.

In an effort to tackle climate change, various sectors, including the transport sector, are turning towards increased electrification. As a result, there has been a swift increase in the sales of electric vehicles (EVs) that use lithium-ion batteries (LIBs). When LIBs reach their end of life in EVs, it may still be possible to use them in other, less demanding applications, giving ...
