How do solar PV brackets work?

The brackets form a simple, fast framing system for steel-framed roofs; solar PV modules are mounted in landscape format at either 5°; or 15°; above the roof sheet, using brackets on a SunLock channel. The channel forms a conduit for cabling. The brackets are backed by a 10-year warranty.

What is included in a solar panel bracket?

The bracket accommodates Enphase, SolarEdge and DirectGrid microinverters and includes all necessary mounting hardware. Wiley grounding clips (WEEB DMC) are used in conjunction with the Module Clamps for grounding PV modules to Ballast Tray.

How does ironridge seismic anchor work?

The IronRidge Seismic Anchor uses the EcoFasten Eco44R to attach to the roof structure and our customer bracket to securely attach to the Ballast Tray. Both the Seismic Anchor and Ballast Tray contain slots to accommodate for placement variances, up to +/- 4 inches of travel in every direction.

What is the design phase of a Solar Roof mounting system?

The design phase of a solar roof mounting system is where technical expertise truly shines. It involves: Site Assessment: A thorough analysis of the installation site is critical. This includes evaluating the roof's condition, orientation, and any potential shading from nearby structures or vegetation.

Where can I find information about ironridge solar panels?

Click on your state and search by city or county. IronRidge makes the strongest mounting systems in solar. Start designing your next project for free with Design Assistant. © 2016 IronRidge, Inc. All rights reserved. Visit or call 1-800-227-9523 for more information.

What is the ideal solar panel angle?

The solar panel angle of your solar system is different depending on which part of the world you are. Solar panels give the highest energy output when they are directly facing the sun. The sun moves across the sky and will be low or high depending on the time of the day and the season. For that reason the ideal angle is never fixed.
