

What is solar photovoltaic (PV) power generation?

Solar photovoltaic (PV) power generation is the process of converting energy from the sun into electricity using solar panels. Solar panels, also called PV panels, are combined into arrays in a PV system. PV systems can also be installed in grid-connected or off-grid (stand-alone) configurations.

What is the IEA photovoltaic power systems technology collaboration programme?

The IEA Photovoltaic Power Systems Technology Collaboration Programme, which advocates for solar PV energy as a cornerstone of the transition to sustainable energy systems. It conducts various collaborative projects relevant to solar PV technologies and systems to reduce costs, analyse barriers and raise awareness of PV electricity's potential.

How efficient is a solar PV system?

Experimental PV cells and PV cells for niche markets, such as space satellites, have achieved nearly 50% efficiency. When the sun is shining, PV systems can generate electricity to directly power devices such as water pumps or supply electric power grids.

How do solar panels generate electricity?

Photovoltaic (PV) technologies - more commonly known as solar panels - generate power using devices that absorb energy from sunlight and convert it into electrical energy through semiconducting materials. These devices, known as solar cells, are then connected to form larger power-generating units known as modules or panels.

How much electricity does solar PV supply?

In 2010, no large power system existed in which solar PV supplied more than 3% of the annual demand. In 2019, solar PV supplied 9% of electricity demand in Germany and 19% in California (Figure 5). Existing plans contemplate penetration higher than 20% in several power systems by 2030. Figure 5.

Is solar photovoltaics ready for the future?

Solar photovoltaics (PV) is a mature technology ready to contribute to this challenge. Throughout the last decade, a higher capacity of solar PV was installed globally than any other power-generation technology and cumulative capacity at the end of 2019 accounted for more than 600 GW.
