

What are the different types of thin-film photovoltaic solar cells?

The main technologies representing the thin-film photovoltaic solar cells include: 1. Cadmium telluride (CdTe) cells. 2. Copper indium gallium selenide (CIGS) cells. 3. Amorphous silicon (a-Si) cells. 4. Gallium arsenide (GaAs) cells. The history of CdTe solar cells dates back to the 1950s.

What is a thin-film solar cell?

The film thickness of a thin-film solar cell differs from a few nanometers (nm) to tens of micrometers (μm), that is much thinner than a commercial silicon wafer ($\sim 200\text{ mm}$), which are the base for fabricating conventional silicon solar cells. Thin-film cells are thus thinner, lighter, and have less drag to counter breakage rates.

Can thin film solar cells reduce the cost of photovoltaic production?

See further details here . Thin film solar cells are one of the important candidates utilized to reduce the cost of photovoltaic production by minimizing the usage of active materials. However, low light absorption due to low absorption coefficient and/or insufficient active layer thickness can limit the performance of thin film solar cells.

Why do thin film solar cells have low light absorption?

However, low light absorption due to low absorption coefficient and/or insufficient active layer thickness can limit the performance of thin film solar cells. Increasing the absorption of light that can be converted into electrical current in thin film solar cells is crucial for enhancing the overall efficiency and in reducing the cost.

Does series resistance limit low-light performance of thin-film solar cells?

The minor role of the R_s is in line with findings for silicon solar cells which report that the series resistance only limits the low-light performance if limitations due to the parallel resistance are negligible (Litzenburger et al., 2014). ... Which Parameters Determine the Low-Light Behaviour of CIGSSe-Based Thin-Film Solar Cells? ...

Can thin-film solar cells achieve 31% power conversion efficiency?

Scientific Reports 9, Article number: 12482 (2019) Cite this article We demonstrate through precise numerical simulations the possibility of flexible, thin-film solar cells, consisting of crystalline silicon, to achieve power conversion efficiency of 31%.
