

# The cost of producing hydrogen from solar power

How much does hydrogen production cost?

The estimates of hydrogen production costs are significantly higher than the current cost of its production from steam methane reforming, which is typically in the range of \$1.50-2.50/kg H<sub>2</sub>.

Can solar power a hydrogen production system?

To partially power this hydrogen production system using solar energy, it is essential to identify hot and cold currents. This allows for the integration of a solar system with a suitable heater if high thermal energy is necessary.

How much hydrogen does a solar system produce a year?

The combined system produces 29,200 kg/year of H<sub>2</sub> with a levelized cost of hydrogen production (LCOP) of \$8.94 per kg of H<sub>2</sub>. Maximum energy destruction was reported in the reactor, followed by the solar collector, which lays a strong foundation for optimizing the collector system to operate more efficiently.

How can solar energy improve hydrogen production?

Improving hydrogen production using solar energy involves developing efficient solar thermochemical cycles, such as the copper-chlorine cycle, and integrating them better with solar thermal systems. Advancements in photolysis for direct solar-to-hydrogen conversion and improving the efficiency of water electrolysis with solar power are crucial.

Are solar-based hydrogen production technologies scalable?

Advancements in photolysis for direct solar-to-hydrogen conversion and improving the efficiency of water electrolysis with solar power are crucial. Comprehensive economic and environmental analyses are essential to support the adoption and scalability of these solar-based hydrogen production technologies.

How can we reduce electricity-based hydrogen production costs?

Continued solar and electrolyzer technology advancements (e.g., suitable rare earth material replacements), and cost reductions (e.g., production process streamlining), are also important for minimizing electricity-based hydrogen production costs.

The cost of producing green hydrogen from solar energy is currently high. This is mainly due to the cost of the photovoltaic systems, which are relatively expensive. However, as the ...

During the three-year project, the cost of photovoltaic (PV) technologies has significantly reduced, while interest has grown in the production of hydrogen from electrolysis. This report, ...

The cost of hydrogen production via water electrolysis is expected to continually reduce over the coming

# The cost of producing hydrogen from solar power

decades with 66-85% reductions by 2050 ... did not address the cost ...

Cost reduction of technologies: Lessons from cost evolution of solar and wind power generation ... Figure 2: Global hydrogen production by main source (%) in 2018<sup>4</sup> Source: Adapted from ...

A sustainable future hydrogen economy hinges on the development of green hydrogen and the shift away from grey hydrogen, but this is highly reliant on reducing production costs, which are currently too high for ...
