

The generator room exhaust shaft is the smallest

Where should a diesel generator room be located?

1. Determination of diesel generator room: Considering the air intake, exhaust and smoke exhaust of the diesel generator set, the machine room is preferably located in the first floor if possible.

What is the layout of equipment in a generator room?

Layout of equipment in the machine room: The equipment layout shall be based on the unit capacity and number of units, and shall be compact, economical and reasonable, safe and easy to maintain. When there is only one unit in the generator room, if the unit capacity is 500kW or less, there is generally no control room.

Where should a generator room be located?

Locating the room above the lowest level of the building is preferred. Separate the generator room from occupied areas or provide sound-proofing and vibration isolation so the EPS will have minimal impact on surrounding areas. Generator room designs should maintain the sound criteria of the surrounding areas.

What are the code requirements for generator exhaust?

To investigate code requirements for generator exhaust it is important to start by reviewing the International Mechanical Code (IMC). Section 915 of IMC 2018 regarding Engine and Gas Turbine-Powered Equipment and Appliances is applicable stating: 915.1 General.

How do I design a generator room?

Space and room requirements for EPSs shall be determined and accounted for during the Schematic Design Phase. Locating the room above the lowest level of the building is preferred. Separate the generator room from occupied areas or provide sound-proofing and vibration isolation so the EPS will have minimal impact on surrounding areas.

Can a generator have a control room?

When there is only one unit in the generator room, if the unit capacity is 500kW or less, there is generally no control room. At this time, the power distribution screen and control panel are conveniently arranged on the generator end or the generator side.
