

The role of the photovoltaic inverter current limiter

How to provide voltage support in PV inverter?

To provide voltage support at the PCC, reactive power is injected into the grid under fault conditions as per the specified grid codes. As previously discussed, the simultaneous injection of peak active power from PVs and reactive power into the grid for voltage support can trigger the over current protection mechanism in PV inverter.

What are the limiting factors of a PV inverter?

The main limiting factors are the output power ramp rate and the maximum power limit. The output power of a PV inverter is limited by its ramp rate and maximum output limit. Ramp rate is usually defined as a percentage of the apparent power or rated power per second.

What is over current protection mechanism in PV inverter?

As previously discussed, the simultaneous injection of peak active power from PVs and reactive power into the grid for voltage support can trigger the over current protection mechanism in PV inverter. The triggering of over current protection will lead to disconnection of inverter from the grid which is unfavourable during LVRT period.

What is a voltage based limiter?

Voltage-based limiters In voltage-based limiters, or indirect limiters, the inverter keeps the voltage source behaviour. The current is controlled indirectly by actuating over the voltage setpoint. Compared to current-based limiters, they provide higher flexibility from inner controller perspective, removing the need of current regulators.

What are the goals of grid-connected PV inverters?

Under grid voltage sags, over current protection and exploiting the maximum capacity of the inverter are the two main goals of grid-connected PV inverters. To facilitate low-voltage ride-through (LVRT), it is imperative to ensure that inverter currents are sinusoidal and remain within permissible limits throughout the inverter operation.

How to integrate a control system with a PV inverter?

One solution is to utilize the communications capabilities of protective relays, meters, and PV inverters to integrate an active control system. This system compares the common-point power factor to the utility requirements and calculates a control signal to adjust the inverter outputs.
