What are base year costs for utility-scale battery energy storage systems?

Base year costs for utility-scale battery energy storage systems (BESSs) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2023). The bottom-up BESS model accounts for major components, including the LIB pack, the inverter, and the balance of system (BOS) needed for the installation.

What is the bottom-up cost model for battery energy storage systems?

Current costs for utility-scale battery energy storage systems (BESS) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Feldman et al., 2021). The bottom-up BESS model accounts for major components, including the LIB pack, inverter, and the balance of system (BOS) needed for the installation.

How do I view cost details for utility-scale storage?

Cost details for utility-scale storage (4-hour duration, 240-megawatt hour [MWh] usable) Press ESC to clear any mark selections. Press Enter to navigate through the marks on the visualization. Capital costs by category. Hover over the bars or select items in the legend to see how cost components change for each scenario.

Do battery costs scale with energy capacity?

However, not all components of the battery system cost scale directly with the energy capacity (i.e., kWh) of the system (Feldman et al. 2021). For example, the inverter costs scale according to the power capacity (i.e., kW) of the system, and some cost components such as the developer costs can scale with both power and energy.

Are battery storage costs based on long-term planning models?

Battery storage costs have evolved rapidly over the past several years, necessitating an update to storage cost projections used in long-term planning models and other activities. This work documents the development of these projections, which are based on recent publications of storage costs.

Can power and energy costs be used to determine utility-scale Bess costs?

The power and energy costs can be used to determine the costs for any duration of utility-scale BESS. Definition: The bottom-up cost model documented by (Ramasamy et al., 2022) contains detailed cost components for battery-only systems costs (as well as batteries combined with photovoltaics [PV]).

For EV battery pack price data, a 30% premium was added to make the values comparable to stationary systems by accounting for racking costs (additional cabling, labor, etc.) along with advantages related to scaling for EV battery packs vs. stationary energy storage battery racks (Baxter, 2020a; Frith, 2020a, 2020b; Goldie-Scot, 2019).

NREL also modelled the costs of 2-hour, 6-hour, 8-hour and 10-hour duration battery storage systems for

The passing of the Inflation Reduction Act in August of 2022 included provisions that are significantly impacting the utility-scale battery storage industry. This includes the decoupling of storage from solar projects, allowing for standalone energy storage projects to qualify for Investment Tax Credits (ITC) up to 30%.

The observed difference in LCOE between utility-scale PV-plus-battery and utility-scale PV technologies (for a given year and resource bin) is roughly in line with empirical power purchase agreement price data for PV-plus-battery systems with comparable battery sizes (Bolinger et al., 2023). However, it is important to note there are inherent ...
