

What is operational mechanism of user-side energy storage in cloud energy storage mode?

Operational mechanism of user-side energy storage in cloud energy storage mode: the operational mechanism of user-side energy storage in cloud energy storage mode determines how to optimize the management, storage, and release of energy storage resources to reduce user costs, enhance sustainability, and maintain grid stability.

What is the current energy storage configuration model?

The current energy storage configuration model does not fully consider the relevant technical parameters and performance characteristics of energy storage. Energy storage is mainly involved in energy scheduling as one of the multiple devices in the integrated energy system.

What is a user-side small energy storage device?

With the new round of power system reform, energy storage, as a part of power system frequency regulation and peaking, is an indispensable part of the reform. Among them, user-side small energy storage devices have the advantages of small size, flexible use and convenient application, but present decentralized characteristics in space.

How does energy storage configuration optimization work?

First, we build an energy storage configuration optimization model based on the user's one-year historical load data to optimize the rated power and capacity of the energy storage, and then calculate the costs and benefits of energy storage, and make a judgment on whether the user is suitable for additional energy storage.

How is energy storage configured?

The energy storage is configured based on the load data for a total of one year from 1 December 2019 to 30 November 2020. Based on the load characteristics of the example in this paper, energy storage only participates in energy scheduling during working days. There are a total of 252 working days in the selected configuration of energy storage.

When should a small energy storage device be submitted to a platform?

User-side small energy storage devices as well as the power grid need to be submitted to the platform before the day supply/demand power information. The platform side needs to sort out the total supply of power and total demand power information for each time period and release the information.
