Base year costs for utility-scale battery energy storage systems (BESS) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2021). The bottom-up BESS model accounts for major components, including the LIB pack, inverter, and the balance of system (BOS) needed for the installation.

For system operators, battery storage systems can provide grid services such as frequency response, regulation reserves and ramp rate control. It can also defer investments in peak generation and grid reinforcements. Utility-scale battery storage systems can enable greater penetration of variable renewable energy into the grid by storing the

A typical utility-scale battery storage system, on the other hand, is rated in megawatts and hours of duration, such as Tesla's Mira Loma Battery Storage Facility, which has a rated capacity of 20 megawatts and a 4-hour

duration (meaning it can store 80 megawatt-hours of usable electricity).

Conventional utility grids with power stations generate electricity only when needed, and the power is to be consumed instantly. This paradigm has drawbacks, including delayed demand response, massive energy waste, and ...
