Hyme Energy has developed a thermal energy storage system that uses liquid sodium hydroxide to store excess wind and solar power. The principle behind the system involves a large " immersion heater" that heats the sodium hydroxide from 350 degrees up to 700 degrees, at which point the substance retains the heat until it must be converted back into electricity.

Hyme"s compact storage system benefits from hydroxides" high energy density, enabling more energy storage in a smaller space. Scalable capacity Starting at 100 MWh, our storage is designed to meet large-scale demands, giving industries the flexibility and scale they need.
