

## What are the energy storage systems at US military bases

Can long-duration energy storage (LDEs) meet the DoD's 14-day requirement?

This report provides a quantitative techno-economic analysis of a long-duration energy storage (LDES) technology, when coupled to on-base solar photovoltaics (PV), to meet the U.S. Department of Defense's (DoD's) 14-day requirement to sustain critical electric loads during a power outage and significantly reduce an installation's carbon footprint.

Why do military bases rely on a diesel supply chain?

The cost of sustaining this large volume of diesel is significant, and many military bases choose to rely on off-base suppliers of diesel. Unfortunately, during long-duration grid outages, external diesel supplies are often not provided. The risk associated with the diesel supply chain is of great concern to DoD.

How much energy does the DOD use?

Energy is essential for DoD's installations, and DoD is dependent on electricity and natural gas to power their installations. In fiscal year 2022 (20), DoD's installations consumed more than 200,000 million Btu(MMBtu) and spent \$3.96 billion to power, heat, and cool buildings.

How much electricity does a military installation use?

Typical mid-size to large active military installations' peak electric loads range from 10 to 90 MW, and their critical electric loads range from approximately 15% to 35% of the total electric load. Figure 6 illustrates conditions seen on seven different mid-size to large military installations. Figure 6.

Why is a fully integrated baseload system necessary?

A fully integrated system of baseload (that is,on all the time) electricity production, renewables, and energy storage is necessary to maximize the benefits to DODin both permanent installation and expeditionary environments.

## Should the military use solar?

As the American electrical grid shifts toward renewable energy, it's expected that the Armed Forces would do the same -- and a good number already have solar and storage on base. Keeping the lights on is especially important to the military, and solar has proven to be a viable means to do so.
