What is a state of charge (SOC)?

The State of Charge (SoC) represents the percentage of energy stored in a battery or energy storage system relative to its full capacity. SoC is a vital metric for evaluating energy availability and overall system performance. It can be applied to grid-scale or residential battery storage, electric vehicles, and even heating rods.

What does SoC mean in energy management?

SOC is monitored and managed by the Energy Management System. For example, if a battery has an SOC of 80%, it means that 80% of its total energy capacity remains available for use. Conversely, an SOC of 20% implies that 80% of the energy has already been consumed, leaving only 20% of the capacity remaining.

What is a SOC in a battery?

The SOC is closely tied to the battery's capacity and can also be determined as the ratio of the remaining capacity to the rated or maximum capacity specified by the manufacturer. As time passes, every battery ages and degrades, as a result, the SOH goes below its initial level.

How do you calculate SOC on a battery?

If the Q rating is considered to be a fixed value, that is, the remaining charge margin is always equal to the rated capacity minus the discharged charge, then the SOC can be expressed by the following formula, Q discharge indicates the amount of charge that the battery has discharged after the last full charge.

Why is SoC important?

SOC is a crucial metric because it helps users determine when to charge or discharge a battery. SOC is monitored and managed by the Energy Management System. For example, if a battery has an SOC of 80%, it means that 80% of its total energy capacity remains available for use.

What does SoC mean in a cell?

The state of charge (SOC) of a cell denotes the capacity that is currently available as a function of the rated capacity. The value of the SOC varies between 0% and 100%. If the SOC is 100%, then the cell is said to be fully charged, whereas a SOC of 0% indicates that the cell is completely discharged.

A battery storage system works round the clock and therefore compensates for any fluctuations in solar energy supply by storing any excess energy and maximise renewable energy generation. ...
