

Where does the air-cooled generator take in air

How do air cooled generators work?

The air-cooled generators take up half the space of larger and more complex liquid cooled generators and install with as little as 18 inches between the home and generator--subject to local building codes. The generators cool themselves with air blown over the alternator and engine by a fan.

What is the difference between liquid cooled and air cooled generators?

Generally,liquid-cooled engines are used on larger kW generators due to the larger engines required for the higher power output. Air-cooled units use internal fans to force air across the different parts of the generator. This keeps the generator from overheating. Size- Air-cooled generators are smaller than liquid-cooled generators.

How do generators cool themselves?

The generators cool themselves with air blown over the alternator and engine by a fan. This method is less complex than a liquid-cooled generator that uses a cooling system similar to a car with coolant pumped through the engine and radiator.

How does a generator work?

It pulls in the air and pushes it back out into the surrounding area. The second type is an enclosed system. An enclosed system, as the name implies, keeps the air in place. It works to then recirculate the air. As it does, the air is cooled which, in turn, keeps the generator cool.

What is an air cooled generator?

As it does, the air is cooled which, in turn, keeps the generator cool. Air cooled systems have some limits including the risk of overheating. However, air cooled systems are mostly restricted to small standby and portable generators that produce up to 22 kilowatts of power per unit.

How much power does an air cooled generator have?

Air-cooled generators start at 7.5kW and max out at *20-24kW. Manufacturers may rate air-cooled generators at a lower capacity for natural gas than propane, in part due to the limitations of the smaller engines. The larger engines found in liquid cooled models make up the difference and provide the same performance on either natural gas or propane.

Air-cooled generators come with engines that use fans to force air across the engine for cooling, while liquid-cooled generators use enclosed radiator systems for cooling, similar to an automobile. Generally, liquid-cooled ...
